

Faculty/institute topic in the field of "Water and Biodiversity"

Faculty of Pharmacy:

Toxicological and therapeutic potential of invasive plants threatening biodiversity in the Czech Republic

The project aims to describe the most important invasive plants in the Czech Republic and their negative impact on biodiversity, including a description and main locations of occurrence. At the same time, these are very often poisonous or medicinal plants that we can potentially use. The aim is therefore to draw attention to this phenomenon and raise awareness of its potential harmfulness or potential uses. The result will be a comprehensive website, or printed posters or information boards.
